

Communicate with Multiple Network Elements Efficiently With One Easy Tool.

One of the most useful features of IRISnGEN is the ability to drill down directly from the Alarm Viewer to the host device reporting the alarm. It takes only seconds for IRISnGEN to establish seamless connectivity through the reporting SEB to the failing device. Technicians do not have to remember telephone numbers, IP addresses or the login or password required to access the failing system to correct the problem.

Once transparent to the host device, whether it is a PBX, voice mail system, IVR or router, you can work with the system using its native interface. On some systems, a specific mode of terminal emulation is required before you can fully communicate with the device. This requires exact duplication of operations such as escape sequences, screen and cursor controls or keyboard Function Keys to execute maintenance procedures on the host device. Without this ability, the technician's diagnostic functions are limited or impossible. Terminal Emulation gives you the ability to duplicate the most popular terminal types while connected to a remote host.

With so many types and models of systems to manage, it is hard for a tech to remember how to access each device. IRISnGEN automatically chooses the proper host emulation and login values based on the stored database parameters for the host. Terminal Emulation provides Windows-like functions to the character interface of a legacy device by adding cut-and-paste, copy and clear. Icons on a toolbar provide one-click access to the most commonly used functions and a status bar indicates the progress and status of the session.

Technicians can click an icon to send the login and password that are contained in the IRISnGEN database for this host. Since the technician does not see this sensitive data as it is transmitted, passwords and logins are more secure because fewer people know them. While in a session, data can be captured and printed, or command sequences can be pasted onto the command line to eliminate repetitive typing.
